

# [INTERIOR SEATING ARCHITECTURE FOR AIRCRAFT]

## Abstract

A booth-type seating arrangement with fore and aft seats for airplanes and aircraft. A cabinet with a stowable video monitor and pull-up table can be positioned between the seats. Sliding gates integrated into the aisle seat end base can be deployed to form an enclosed play area for children. Theater-style seat bottoms can be provided which flip-up to provide more floor space. Child booster seats can be built into the seatbacks. The seatback and bottom cushions can articulate and slide within fixed frame members to combine with opposite cushions to form a flat sleeping configuration for passengers.
